Note:

- The years 2012 and 2013, which were of testing and settlement of the detection system, are not to be considered. In 2012, the cards for minors were used experimentally only on a sample of 100 children. In 2013, the cards for families were used experimentally only on a very limited sample.

- At the moment the situation seems to remain stable and / or slightly improved, despite the famine just ended that followed the last drought in 2016.

- * For the current year 2018, the data in question are those of the first seven months.
